About me

About Alexander Lin

Alexander Lin is a Computer Science student and a self-proclaimed lifelong learner. He doesn't pretend to know everything—but he's damn good at figuring things out, fast. He's not trying to be a genius coder. He's building to be something better: a systems thinker. An architecture-focused developer who designs modular, purposeful tools that don't just work—they evolve.

He has a deep curiosity for AI and prompt engineering, with hands-on experience creating tools that integrate Oracle Cloud, GenAI services, and document-based RAG pipelines. It's not just work to him—it's fun. A puzzle to solve with each new project.

Though still early in his career, Alexander's interests are wide and ambitious. He's fascinated by cybersecurity and already dabbling in that world, even if the résumé doesn't show it yet. His projects reflect a clear mindset: thoughtful, precise, and designed for scale.

More than anything, he prides himself on being a fast learner with high standards. His approach is structured, but not stiff. Casual, but sharp. Whether he's designing a chatbot, building a custom tool, or exploring new systems for fun—he brings intensity, creativity, and clarity to the table.

If you asked him what kind of developer he is, he'd probably tell you, "I'm just a chill guy who likes building smart shit." And he's not wrong.
